

Automotive high speed CAN bus transceiver

Datasheet - production data

Features

- AEC-Q100 qualified
- ISO/DIS 11898 up to 1 Mbaud
- Transmitter:
 - Generation of differential output signals
 - Short circuit protected from -5 V to 36 V, detection and shutdown

- Slope control to reduce RFI and EMI
- Two states adjustable slope control (≤ 1 Mbaud / ≤ 250 Kbaud)
- Receiver:
 - Differential input with high interference suppression
 - Common mode input voltage range (V_{COM}) from -2 V to V_S+3 V
- ESD protection level up to 4 kV
- Package: SO-8

Description

The L9616 is a bidirectional transceiver for signal conditioning and processing in connection with a CAN controller. Data rates of up to 1 Mbaud are supported using either shielded or non-shielded pair of lines.

4 Functional description

The L9616 is used as an interface between a CAN controller and the physical bus. The device provides transmitting capability to the CAN controller.

The transmitter outputs C_H and C_L are protected against short circuits and electrical transients which may occur in an automotive environment.

In case of short circuit (C_H to C_L, C_H to B) the protection circuit recognizes this fault condition and the transmitter output stages are disabled with a delay of max. 10 ms to prevent destruction of the IC and high consumption of supply current I_S . If $V_{C_L} > V_{C_L\ max}$ the transmitter output stages would be disabled immediately.

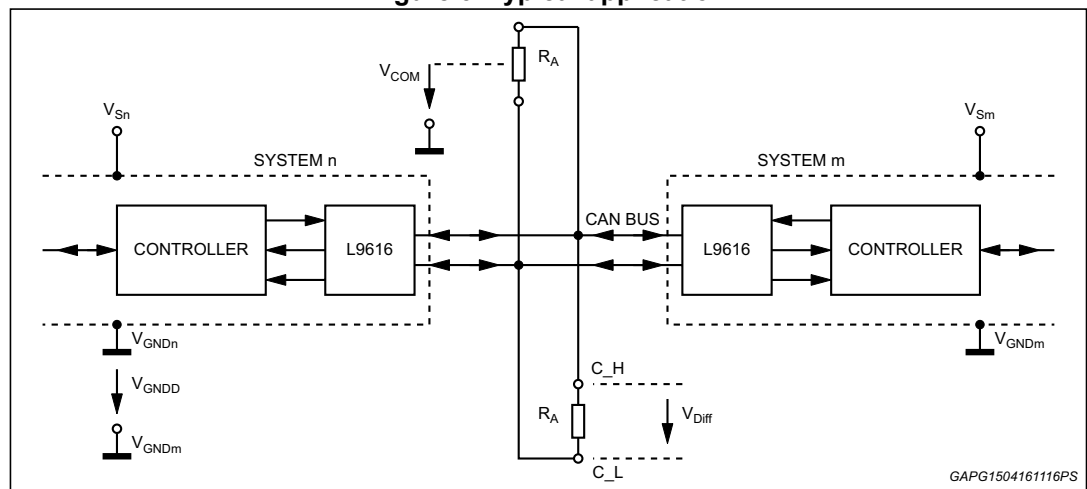

Pin ASC makes it possible to select two different modes of operation: high speed (≤ 1 Mbaud) and low speed (≤ 250 kbaud).

The ASC pin is tied to GND for normal operation at ≤ 1 Mbaud. For slower speed operation at ≤ 250 kbaud the rise and fall slope of the bus output can be decreased to reduce EMI by connecting the ASC pin to V_S .
