

REF10

Precision **VOLTAGE REFERENCE**

FEATURES

- +10.00V OUTPUT
- HIGH ACCURACY: ±0.005V Untrimmed
- VERY-LOW DRIFT: 1ppm/°C max
- EXCELLENT STABILITY: 10ppm/1000hrs typ
- LOW NOISE: 6µVp-p typ, 0.1Hz to 10Hz
- WIDE SUPPLY RANGE: Up to 35V

APPLICATIONS

- PRECISION CALIBRATED VOLTAGE **STANDARD**
- TRANSDUCER EXCITATION
- D/A AND A/D CONVERTER REFERENCE
- PRECISION CURRENT REFERENCE
- ACCURATE COMPARATOR THRESHOLD REFERENCE
- DIGITAL VOLTMETERS
- TEST EQUIPMENT

DESCRIPTION

The REF10 is a precision voltage reference which provides a +10.00V output. The drift is laser-trimmed to 1ppm/°C max (KM grade) over the full specification range. This is in contrast to some references which guarantee drift over a limited portion of their specification temperature range. The REF10 achieves its precision without a heater. This results in low quiescent current, fast warm-up, excellent stability, and low noise.

The output can be adjusted with minimal effect on drift or stability. Single supply operation over 13.5V to 35V supply range and excellent overall specifications make the REF10 an ideal choice for the most demanding applications such as precision system standard, D/A and A/D references, transducer excitation, etc.

NOTES: (1) Trimming the offset voltage will affect the drift slightly. See Installation and Operating Instructions for details. (2) The "box method" is used to specify output voltage drift vs temperature. See the Discussion of Performance section. (3) Sample tested with power applied continuously.

ORDERING INFORMATION

MODEL	PACKAGE	TEMPERATURE RANGE	MAX DRIFT (ppm/°C)
REF10JM	Metal TO-99	0°C to +70°C	3
REF10KM	Metal TO-99	0°C to +70°C	1
REF10RM	Metal TO-99	-55°C to +125°C	6
REF10SM	Metal TO-99	-55°C to +125°C	3

PACKAGE INFORMATION

MODEL	PACKAGE	PACKAGE DRAWING NUMBER ⁽¹⁾
REF10JM	8-Pin Metal TO-99	001
REF10KM	8-Pin Metal TO-99	001
REF10RM	8-Pin Metal TO-99	001
REF10SM	8-Pin Metal TO-99	001

NOTE: (1) For detailed drawing and dimension table, please see end of data sheet, or Appendix D of Burr-Brown IC Data Book.

ABSOLUTE MAXIMUM RATINGS

Input Voltage	
Power Dissipation at +25°C	200mV
Operating Temperature	
J, K	–25°C to +85°C
R, S	–55°C to +125°C
Storage Temperature Range	–65°C to +125°C
Lead Temperature (soldering, 10s)	+300°C
Short-Circuit Protection at +25°C	
to Common or +15VDC	Continuous

PIN CONFIGURATION

NOTE: (1) Pin 3 is an unbuffered 6.3V output. Any load will affect the output voltage and drift. A load of 1 μ A on pin 3 will typically change the output voltage by 50 μ V and the drift by 0.1ppm/°C.

THEORY OF OPERATION

The following discussion refers to the diagram on the first page.

In operation, approximately 6.3V is applied to the noninverting input of op amp A_1 by zener diode D_{z1} . This voltage is amplified by A_1 to produce the 10.00V output. The gain is determined by R_1 and R_2 : $G = (R_1 + R_2)/R_1$. R_1 and R_2 are actively laser-trimmed to produce an exact 10.00V output. The zener operating current is derived from the regulated output voltage through R_3 . This feedback arrangement provides closely regulated zener current. R_3 is actively laser-trimmed to set the zener current to a level which results in low drift at the output of A_1 . R_4 allows user-trimming of the output voltage by providing for a small external adjustment of amplifier gain. Since the TCR of R_4 closely matches the TCR of the gain setting resistors, the voltage trim has minimal effect on the drift of the reference.

DISCUSSION OF PERFORMANCE

The REF10 is designed for applications requiring a precision voltage reference where both the initial value at room temperature and the drift over temperature are of importance to the user. Two basic methods of specifying voltage reference drift versus temperature are in common usage in the industry—the "butterfly method" and the "box method." The REF10 is specified with the more commonly used box method. The "box" is formed by the high and low specification temperatures and a diagonal, the slope of which is equal to the maximum specified drift.

For the REF10, each J and K unit is tested at temperatures of 0°C, +25°C, +50°C, and +70°C. Each R and S unit is tested at -55°C, -25°C, 0°C, +25°C, +50°C, +75°C, +100°C and +125°C. The minimum and maximum test voltages must meet this condition:

$$\left[\frac{\left(V_{OUT MAX} - V_{OUT MIN}\right) / 10V}{T_{HIGH} - T_{LOW}}\right] X \, 10^{6} \le \frac{\text{Drift}}{\text{Specification}}$$

This assures the user that the variations of output voltage that occur as the temperature changes within the specification range, T_{LOW} to T_{HIGH} , will be contained within a box whose diagonal has a slope equal to the maximum specified drift. Since the shape of the actual drift curve is not known, the vertical position of the box is not exactly known either. It is, however, bounded by $V_{UPPER BOUND}$ and $V_{LOWER BOUND}$ (see Figure 1).

Figure 1 uses the REF10KM as an example. It has a drift specification of 1ppm/°C maximum and a specification temperature range of 0°C to +70°C. The "box" height (V₁ to V₂) is 700 μ V, and upper bound and lower bound voltages are a maximum of 700 μ V away from the voltage at +25°C.

INSTALLATION AND OPERATING INSTRUCTIONS

BASIC CIRCUIT CONNECTION

Figure 2 shows the proper connection of the REF10. To achieve the specified performance, pay careful attention to layout. A low resistance star configuration will reduce voltage errors, noise pickup, and noise coupled from the power supply. Commons should be connected as indicated being sure to minimize interconnection resistances.

FIGURE 2. REF10 Installation.

OPTIONAL OUTPUT VOLTAGE ADJUSTMENT

Optional output voltage adjustment circuits are shown in Figures 3 and 4. Trimming the output voltage will change the voltage drift by approximately 0.01ppm/°C per mV of trimmed voltage. In the circuit in Figure 3, any mismatch in TCR between the two sections of the potentiometer will also

affect drift, but the effect of the Δ TCR is reduced by a factor of 40 by the internal resistor divider. A high quality potentiometer with good mechanical stability, such as a cermet, should be used. The circuit in Figure 3 has a range of approximately +250mV to -100mV. The circuit in Figure 4 has less range but provides higher resolution. The mismatch in TCR between R_s and the internal resistors can introduce some slight drift. This effect is minimized if R_s is kept significantly larger than the 156k Ω internal resistor. A TCR of 100ppm/°C is normally sufficient.

FIGURE 4. REF10 Optional Output Voltage Fine Adjust.

APPLICATION INFORMATION

High accuracy, extremely-low drift, and small size make the REF10 ideal for demanding instrumentation and system voltage reference applications. Since no heater is required, low power supply current designs are readily achievable. Also the REF10 has lower output noise and much faster warm-up times than heated references, permitting high precision without extra power or additional supplies. It should be considered that operating any integrated circuit at an elevated temperature will reduce its MTTF.

A variety of application circuits are shown in Figures 5 through 11.
