

**SANYO****STK4112II****AF Power Amplifier (Split Power Supply)  
(10W + 10W min, THD = 0.4%)****Features**

- The STK4102II series (STK4112II) and STK4101V series (high-grade type) are pin-compatible in the output range of 6W to 50W and enable easy designing.
- Small-sized package whose pin assignment is the same as that of the STK4101II series
- Built-in muting circuit to cut off various kinds of pop noise
- Greatly reduced heat sink due to substrate temperature 125°C guaranteed
- Excellent cost performance

**Package Dimensions**

unit: mm

**4083****Specifications****Maximum Ratings** at  $T_a = 25^\circ\text{C}$ 

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{CC}$ max		$\pm 26$	V
Thermal resistance	$\theta_{j-c}$		4	$^\circ\text{C/W}$
Junction temperature	$T_j$		150	$^\circ\text{C}$
Operating substrate temperature	$T_c$		125	$^\circ\text{C}$
Storage temperature	$T_{stg}$		$-30$ to $+125$	$^\circ\text{C}$
Available time for load short-circuit	$t_s$	$V_{CC} = \pm 17\text{V}$ , $R_L = 8\Omega$ , $f = 50\text{Hz}$ , $P_o = 10\text{W}$	2	s

**Recommended Operating Conditions** at  $T_a = 25^\circ\text{C}$ 

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	$V_{CC}$		$\pm 17$	V
Load resistance	$R_L$		8	$\Omega$

**Operating Characteristics** at  $T_a = 25^\circ\text{C}$ ,  $V_{CC} = \pm 17\text{V}$ ,  $R_L = 8\Omega$ ,  $R_g = 600\Omega$ ,  $V_G = 40\text{dB}$ ,  
 $R_L$  : non-inductive load

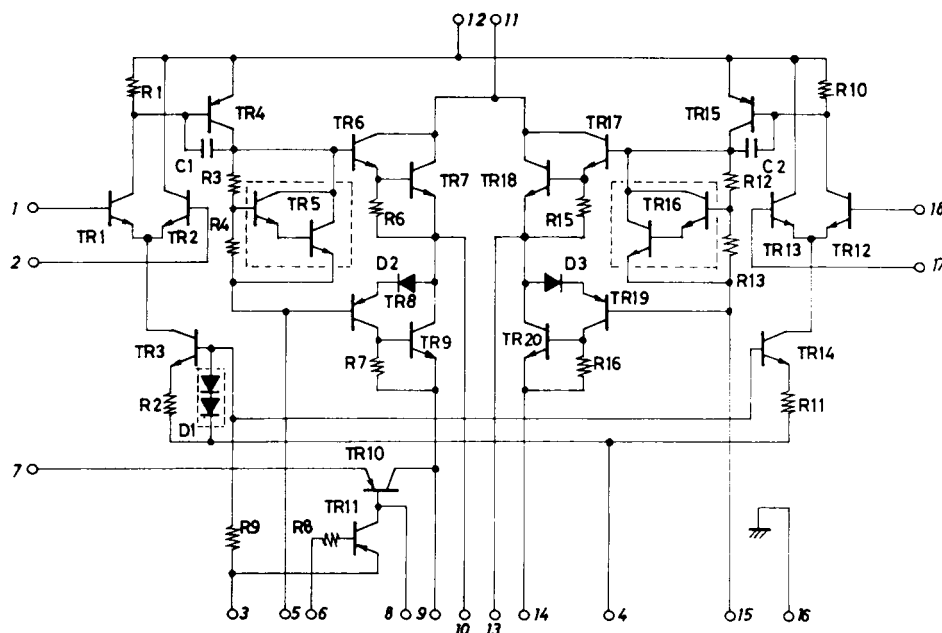

Parameter	Symbol	Conditions	min	typ	max	Unit
Quiescent current	$I_{CCO}$	$V_{CC} = \pm 20.5\text{V}$	20	40	100	mA
Output power	$P_o (1)$	THD = 0.4%, $f = 20\text{Hz to } 20\text{kHz}$	10			W
	$P_o (2)$	$V_{CC} = \pm 14\text{V}$ , THD = 1.0%, $R_L = 4\Omega$ , $f = 1\text{kHz}$	10			W
Total harmonic distortion	THD	$P_o = 1.0\text{W}$ , $f = 1\text{kHz}$			0.3	%
Frequency response	$f_L, f_H$	$P_o = 1.0\text{W}$ , $+0_{-3}\text{ dB}$		20 to 50k		Hz
Input impedance	$r_i$	$P_o = 1.0\text{W}$ , $f = 1\text{kHz}$		55		$k\Omega$
Output noise voltage	$V_{NO}$	$V_{CC} = \pm 20.5\text{V}$ , $R_g = 10k\Omega$			1.2	mVrms
Neutral voltage	$V_N$	$V_{CC} = \pm 20.5\text{V}$	-70	0	70	mV
Muting voltage	$V_M$		-2	-5	-10	V

Notes. For power supply at the time of test, use a constant-voltage power supply unless otherwise specified.  
 For measurement of the available time for load short-circuit and output noise voltage, use the specified transformer power supply shown right.  
 The output noise voltage is represented by the peak value on rms scale (VTVM) of average value indicating type. For AC power supply, use an AC stabilized power supply (50Hz) to eliminate the effect of flicker noise in AC primary line.

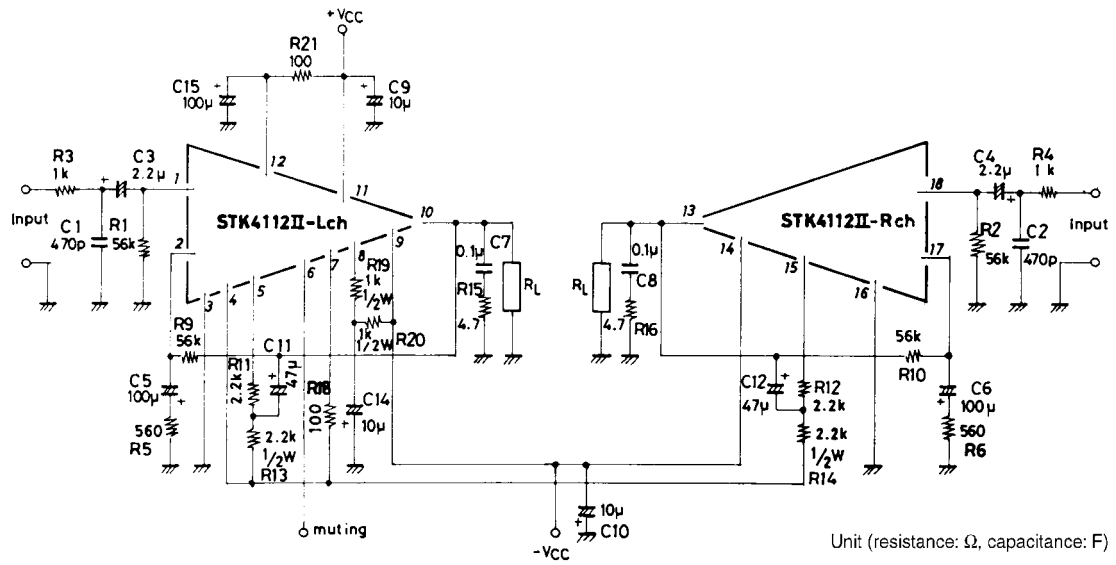

Specified Transformer Power Supply  
 (Equivalent to RP-22)

# Sample Application Circuit 10W min 2-channel AF power amplifier

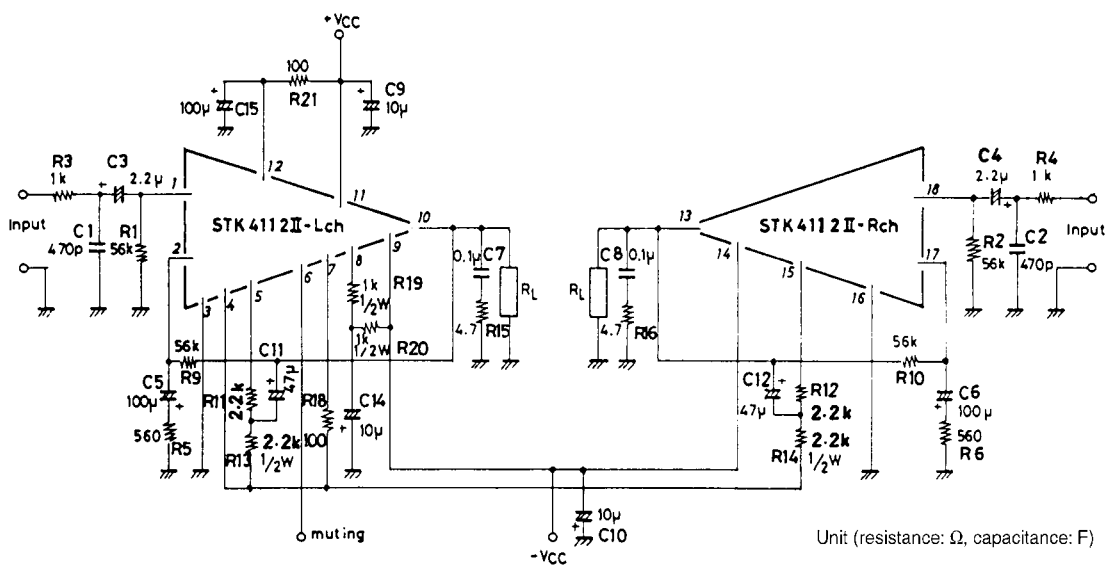

## Sample Printed Circuit Pattern for Application Circuit (Cu-foiled side)

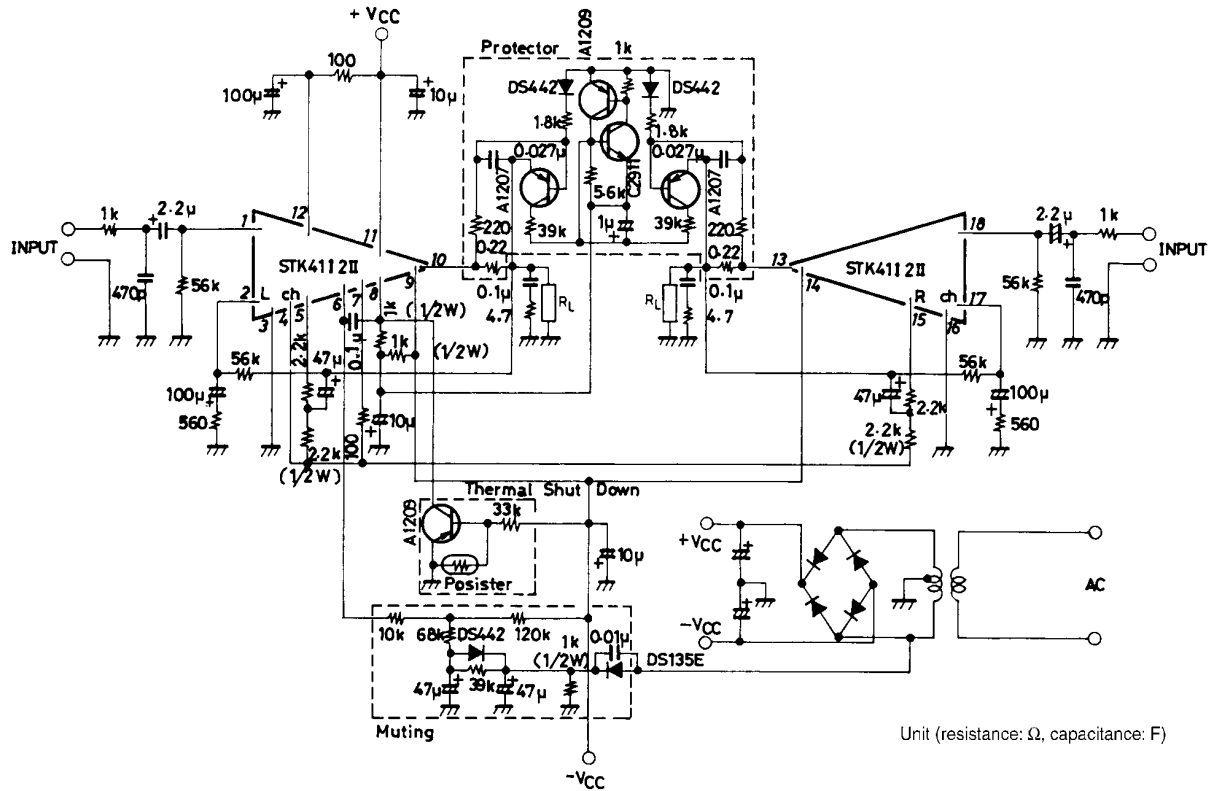

## Description of External Parts

C1, C2	Input filter capacitors • A filter formed with R3 or R4 can be used to reduce noise at high frequencies.
C3, C4	Input coupling capacitors • Used to block DC current. When the reactance of the capacitor increases at low frequencies, the dependence of 1/f noise on signal source resistance causes the output noise to worsen. It is better to decrease the reactance. • To reduce the pop noise at the time of application of power, it is effective to increase C3, C4 that fix the time constant on the input side and to decrease C5, C6 on the NF side.
C5, C6	NF capacitors • These capacitors fix the low cutoff frequency as shown below. $f_L = \frac{1}{2\pi \cdot C5 \cdot R5} \quad [\text{Hz}]$ To provide the desired voltage gain at low frequencies, it is better to increase C5. However, do not increase C5 more than needed because the pop noise level becomes higher at the time of application of power.
C15	Decoupling capacitor • Used to eliminate the ripple components that mix into the input side from the power line (+V <sub>CC</sub> ).
C11, C12	Bootstrap capacitors • When the capacitor value is decreased, the distortion is liable to be higher at low frequencies.
C9, C10	Oscillation blocking capacitors • Must be inserted as close to the IC power supply pins as possible so that the power supply impedance is decreased to operate the IC stably. • Electrolytic capacitors are recommended for C9, C10.
C14	Capacitor for ripple filter • Capacitor for the TR10-used ripple filter in the IC system
C7	Oscillation blocking capacitor • A polyester film capacitor, being excellent in temperature characteristic, frequency characteristic, is recommended for C7.
R3, R4	Resistors for input filter
R1, R2	Input bias resistors • Used to bias the input pin potential to zero. These resistors fix the input impedance practically.
R5, R9 (R6, R10)	These resistors fix voltage gain V <sub>G</sub> . It is recommended to use R5 (R6) = 560Ω, R9 (R10) = 56kΩ for V <sub>G</sub> = 40dB. • To adjust V <sub>G</sub> , it is desirable to change R9 (or R10). • When R9 (or R10) is changed to adjust V <sub>G</sub> , R1 (=R2) = R9 (=R10) must be set to ensure V <sub>N</sub> balance.
R11, R13 (R12, R14)	Bootstrap resistors • The quiescent current is set by these resistors 2.2kΩ + 2.2kΩ. It is recommended to use this resistor value.
R21	Resistor for ripple filter (Limiting resistor for predriver transistor at the time of load short)
R18	Used to ensure plus/minus balance at the time of clip.
R19, R20	Resistor for ripple filter • When muting TR11 is turned ON, current flows from ground to -V <sub>CC</sub> through TR 11. It is recommended to use 1kΩ (1/2W) + 1kΩ (1/2W) allowing for the power that may be dissipated on that occasion.
R15, R16	Oscillation blocking resistors

## Sample Application Circuit (protection circuit and muting circuit)

## Thermal Design

The IC power dissipation of the STK4112II at the IC-operated mode is 16.3W max. at load resistance  $8\Omega$  and 20.9W max. at load resistance  $4\Omega$  (simultaneous drive of 2 channels) for continuous sine wave as shown in Figure 1 and 2.

Figure 1. STK4112II  $P_d - P_O$  ( $R_L = 8\Omega$ )

Figure 2. STK4112II  $P_d - P_O$  ( $R_L = 4\Omega$ )

In an actual application where a music signal is used, it is impractical to estimate the power dissipation based on the continuous signal as shown above, because too large a heat sink must be used. It is reasonable to estimate the power dissipation as 1/10 Po max. (EIAJ).

That is, Pd = 10.1W at 8Ω, Pd = 11.4W at 4Ω

Thermal resistance θc-a of a heat sink for this IC power dissipation (Pd) is fixed under conditions 1 and 2 shown below.

$$\text{Condition 1: } T_c = P_d \times \theta_{c-a} + T_a \leq 125^\circ\text{C} \dots\dots\dots (1)$$

where Ta : Specified ambient temperature  
Tc : Operating substrate temperature

$$\text{Condition 2: } T_j = P_d \times (\theta_{c-a}) + P_d/4 \times (\theta_{j-c}) + T_a \leq 150^\circ\text{C} \dots\dots\dots (2)$$

where Tj : Junction temperature of power transistor

Assuming that the power dissipation is shared equally among the four power transistors (2 channels × 2), thermal resistance θj-c is 4.0°C/W and

$$P_d \times (\theta_{c-a} + 4/4) + T_a \leq 150^\circ\text{C} \dots\dots\dots (3)$$

Thermal resistance θc-a of a heat sink must satisfy inequalities (1) and (3).

Figure 3 shows the relation between Pd and θc-a given from (1) and (3) with Ta as a parameter.

[Example] The thermal resistance of a heat sink is obtained when the ambient temperature specified for a stereo amplifier is 50°C.

Assuming VCC = ±17V, RL = 8Ω,

VCC = ±14V, RL = 4Ω,

RL = 8Ω : Pd1 = 10.1W at 1/10 Po max.

RL = 4Ω : Pd2 = 11.4W at 1/10 Po max.

The thermal resistance of a heat sink is obtained from Figure 3.

RL = 8Ω : θc-a1 = 7.43°C/W

RL = 4Ω : θc-a2 = 6.58°C/W

Tj when a heat sink is used is obtained from (3).

RL = 8Ω : Tj = 135.1°C

RL = 4Ω : Tj = 136.4°C
